

5 Ways to Improve Security on your iPhone

07.22.2015

iOS

Method 1 - Use a Password Manager

Use a Password Manager, such as LastPass, to remember the long passwords for you, and secure all of them using a master password. As these passwords are encrypted and managed centrally you can control access to them even if your device is stolen.

LastPass – Password Manager & Secure Vault

Method 2 - Keep Your Web History Private

When using Safari, turn on the “Private Browsing” feature so that your browsing is not tracked across the internet, via cookies or other identifying information.

Method 3 - Use Two- Step Verification

Combine two different security features like using a password and a biometric login system to access your device.

Method 4 - Using a Strong Passcode or Password

Choose an alphanumeric password that will not be guessed easily by others, hence making it difficult for people to login. Don't use obvious passcodes like 0000 or 8888

Method 5 - Using TouchID

If you have iPhone 5S or higher, you will have the benefit of using TouchID, which enables you to access your device using your fingerprints.
